

CHAPTER – 01

INTRODUCTION

1.1 – Project Overview

- This project is about where data analytics, retail strategy and cosmetic science meet. We look at a set of retail data to figure out what products are available in the market how they are priced and how companies position themselves to include all kinds of consumers. The project then uses this information to create easy to understand pictures and charts that are shown on business intelligence dashboards for top managers. These dashboards help people make decisions about retail strategy, for cosmetic science and data analytics projects.
- This research seeks to analyze the skincare and cosmetic industry dynamics that will enable retailers, developers, and marketers make evidence-based decisions. Analysis of the industry dynamics will be based on four pillars:
- Inventory & Assortment Strategy: Knowing which product categories and brands rule the shelves.
- Pricing Architecture: Evaluating the premium and starter pricing segments as well as value of the category.
- Product Inclusiveness: Assessing the level of representation of different skin types (Combination, Dry, Normal, Oily, and Sensitive).

Customer Sentiment: Linking pricing with compatibility as a driver of product rankings
