

COSMETIC INSIGHTS: Navigating Cosmetics Trends and Consumer Insights With Tableau

2.1 – Purpose of the Project

There is usually a challenge faced by cosmetic companies in the form of trying to gather fragmented information about their products through feedback from consumers and analyzing sales metrics. In order to solve this problem and come up with the right cosmetic strategy, it is necessary to use Tableau for analyzing and visualizing complex datasets related to the cosmetic industry.

The beauty and cosmetics industry can be considered very dynamic due to changing trends such as skin investments and clean beauty. Due to the lack of a single platform for interaction and analyzing the data, many cosmetics companies fail to notice the seasonal trends, identify their best selling products or understand what customers actually want.

Disconnection of Data

It can be hard to analyze the collected information since there is disconnection between the datasets containing information on consumer demographics, purchasing history, and product ratings.

Identifying Trends

There is always an issue of identifying which product categories or particular features (e.g., vegan ingredients, sustainability, etc.) make certain products sell better.
