

COSMETIC INSIGHTS: Navigating Cosmetics Trends and Consumer Insights with Tableau

9.2 – Disadvantages

1. Data Quality Dependence

Insights' accuracy is based heavily on the dataset's quality. If the data is incomplete, bad, or not up-to-date, insights will be incorrect.

2. Limited Real-Time Integration

The system does provide data trend analyses; however, for real-time streaming of data, higher-end infrastructure is needed, and much of that is not yet built in most basic systems

3. Tool Dependency

The project is dependent on tools such as Tableau Desktop and Python. Any issues related to the tools (e.g., limitations, licensing, compatibility) can dramatically affect workflow.

4. Need for Technical Knowledge

Users need to have technical knowledge in data preprocessing, visualization, and analytics in order to operate the system as intended. Non-technical users may find it difficult to operate and/or interpret results.

5. Performance Issues with Large Datasets

Very large datasets, such as those found in the cosmetics industry, may slow down the processing of Tableau or Python applications/visualizations unless the systems are optimized first.

6. External Market Factors

The dataset may not take into account certain external factors (e.g., economic changes, social media trends, competitor strategy, etc.) that can influence the accuracy of real-world results.

7. Need for Maintenance and Updates

Insights generated will only be relevant if the datasets and dashboards are updated on a regular basis, which puts a need for constant work to remain true.

8. Interpretation Bias

Even if the data is absolutely correct, the way people interpret the charts or dashboards could lead to poor business decisions.
