

CHAPTER – XI

FUTURE SCOPE

11.1 - Future Scope

1. Live Data Integration

The project could be enhanced with the addition of live data streaming capabilities from e-commerce sites, social media platforms and retail systems, which will enable immediate trend analysis of cosmetics and thus improve responsiveness.

2. Machine Learning to Make Predictions

Incorporating sophisticated models built with Python will allow the system to accurately forecast future sales volume of products, consumer preferences and new cosmetic/decorating trends.

3. AI-based Recommendation Engine

The project could eventually become a personalized recommendation engine that suggests products based on consumers' skin types, past purchases, and shopping/exploration behaviours.

4. Analysis of Global Markets

Future iterations could support a globalised marketplace through the addition of foreign country/brand demographics and compiled databases of corresponding trends.

5. Social Media Sentiment Analysis

Utilising review and comment data from the likes of Instagram, YouTube and Twitter, organisations will gain greater insight into consumer views about their products and brands.

6. Improved Dashboard Functions

Using Tableau Desktop, dashboards could be constructed with improved interactive filtering capabilities, Real-Time Key Performance Indicators (KPI's) and artificial intelligence driven visual insights.

7. Integration With E-Commerce Platforms

The system could be integrated with online e-commerce platforms to drill down into sales performance, customer behaviour and conversion figures.

8. Intelligent Inventory Control

By utilising future developments the organisations should be able to automatically adjust inventory levels based on predictions, resulting in less overstock and fewer out-of-stock events.
